(54) Title: METHOD AND SYSTEM FOR GENERATION OF REAL-TIME GUIDING INFORMATION

(57) Abstract: A system and method is disclosed for generating information for use, for example, in a vehicle for guidance of driver. Information is described by information object specifications determined in part from compiled data related to the vehicle and its immediate environment, navigation area, target area, and user profile. An analysis and control part (320, 340) of the system creates information objects, optionally assigns priority to the same, and assigns a medium for presentation of an information object. A system state may be determined related to current use of available media. An information object of high priority can cause the control part to reallocate a medium to allow presentation of the high priority information object. The system may further determine need for format transcoding to allow presentation of information on the most appropriate medium.
